

# oefeningen hoofdstuk 8 - tijdsreeksen

*TijsMartens*

*12 april 2019*

**voorbeelden van in de les.**

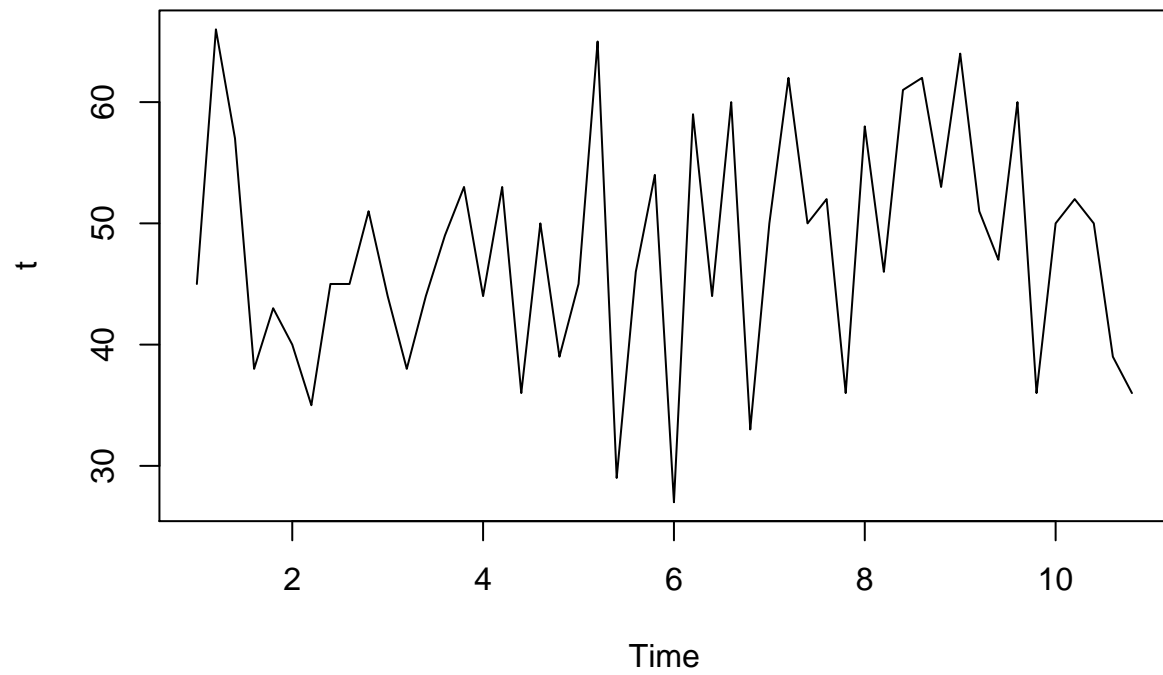

```
x <- round(rnorm(50, 50, 10))
x
```

```
## [1] 45 66 57 38 43 40 35 45 45 51 44 38 44 49 53 44 53 36 50 39 45 65 29
## [24] 46 54 27 59 44 60 33 50 62 50 52 36 58 46 61 62 53 64 51 47 60 36 50
## [47] 52 50 39 36
```

```
t <- ts(x, frequency = 5)
t
```

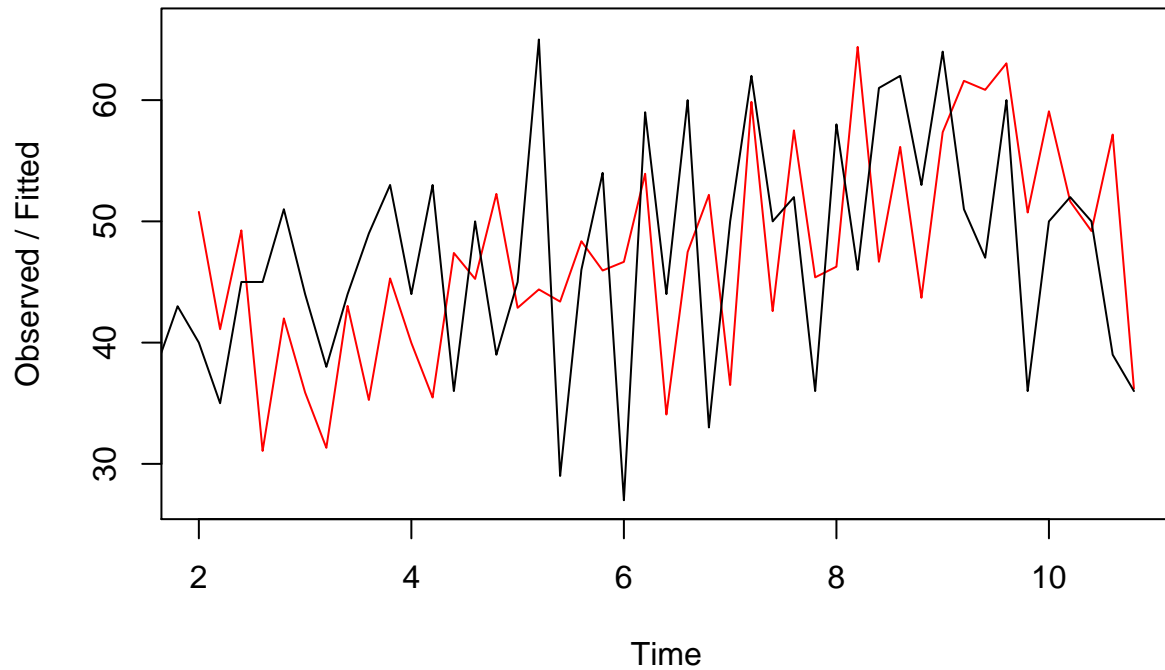

```
## Time Series:
## Start = c(1, 1)
## End = c(10, 5)
## Frequency = 5
## [1] 45 66 57 38 43 40 35 45 45 51 44 38 44 49 53 44 53 36 50 39 45 65 29
## [24] 46 54 27 59 44 60 33 50 62 50 52 36 58 46 61 62 53 64 51 47 60 36 50
## [47] 52 50 39 36
```

```
plot(t)
```

```
fit <- HoltWinters(t)
plot(fit)
```

## Holt-Winters filtering

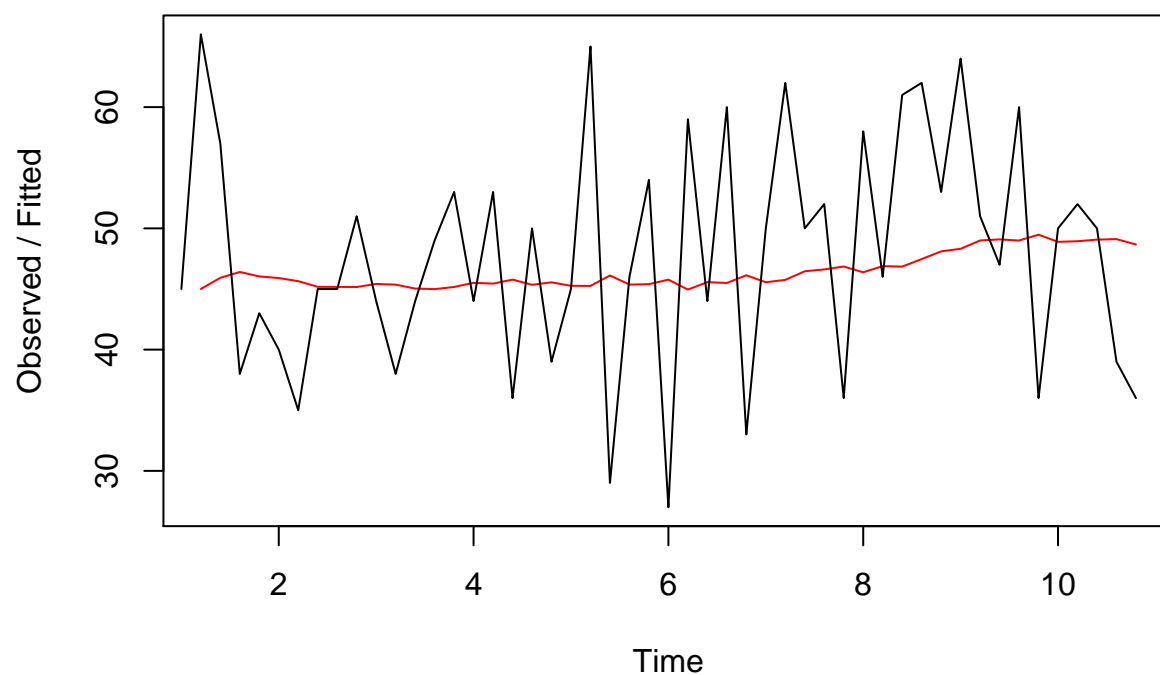

```
fit
```

```
## Holt-Winters exponential smoothing with trend and additive seasonal component.
##
## Call:
## HoltWinters(x = t)
##
## Smoothing parameters:
##  alpha: 0.1161002
##  beta : 0.3128107
##  gamma: 0.5237156
##
## Coefficients:
##      [,1]
## a  43.652793
## b  -1.172107
## s1  5.418399
## s2  3.954051
## s3  2.208674
## s4  1.803770
## s5 -7.566662
```

merk op dat alpha heel klein is

```
fit <- HoltWinters(t,beta = FALSE, gamma =FALSE)
plot(fit)
```

## Holt-Winters filtering

```
fit

## Holt-Winters exponential smoothing without trend and without seasonal component.
##
## Call:
## HoltWinters(x = t, beta = FALSE, gamma = FALSE)
##
## Smoothing parameters:
##  alpha: 0.04373445
##  beta : FALSE
##  gamma: FALSE
##
## Coefficients:
##      [,1]
## a 48.11559
```

merk op dat alpha groter is

## voorpselling maken

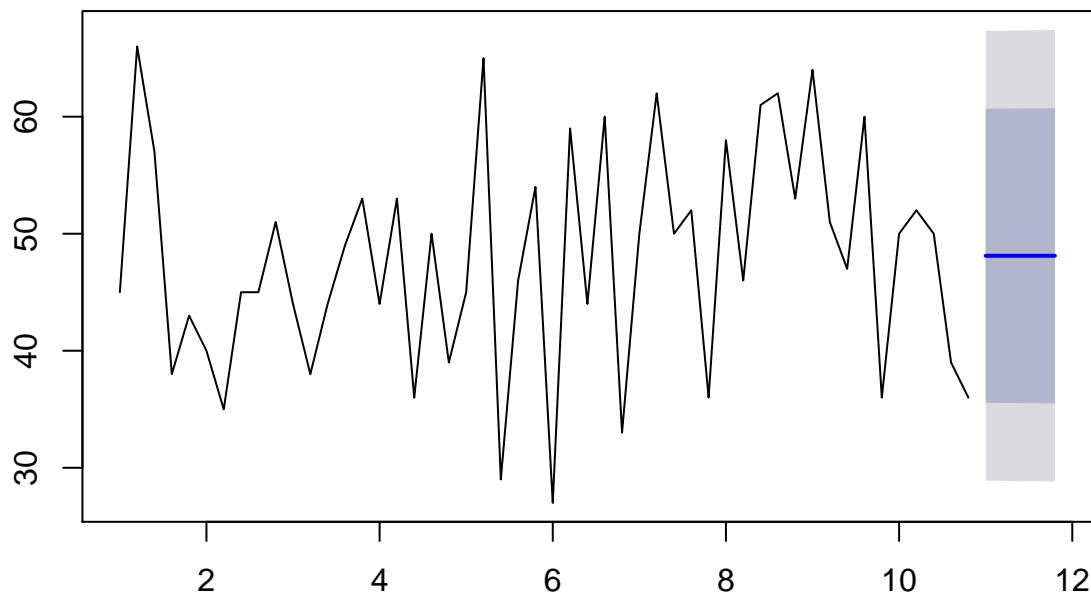

```
library(forecast)

## Warning: package 'forecast' was built under R version 3.5.3
f <- forecast(fit, 5)
f
```

##	Point Forecast	Lo 80	Hi 80	Lo 95	Hi 95
## 11.00	48.11559	35.54969	60.68148	28.89771	67.33346
## 11.20	48.11559	35.53768	60.69349	28.87934	67.35183
## 11.40	48.11559	35.52568	60.70549	28.86099	67.37018
## 11.60	48.11559	35.51369	60.71748	28.84265	67.38852
## 11.80	48.11559	35.50172	60.72946	28.82434	67.40684

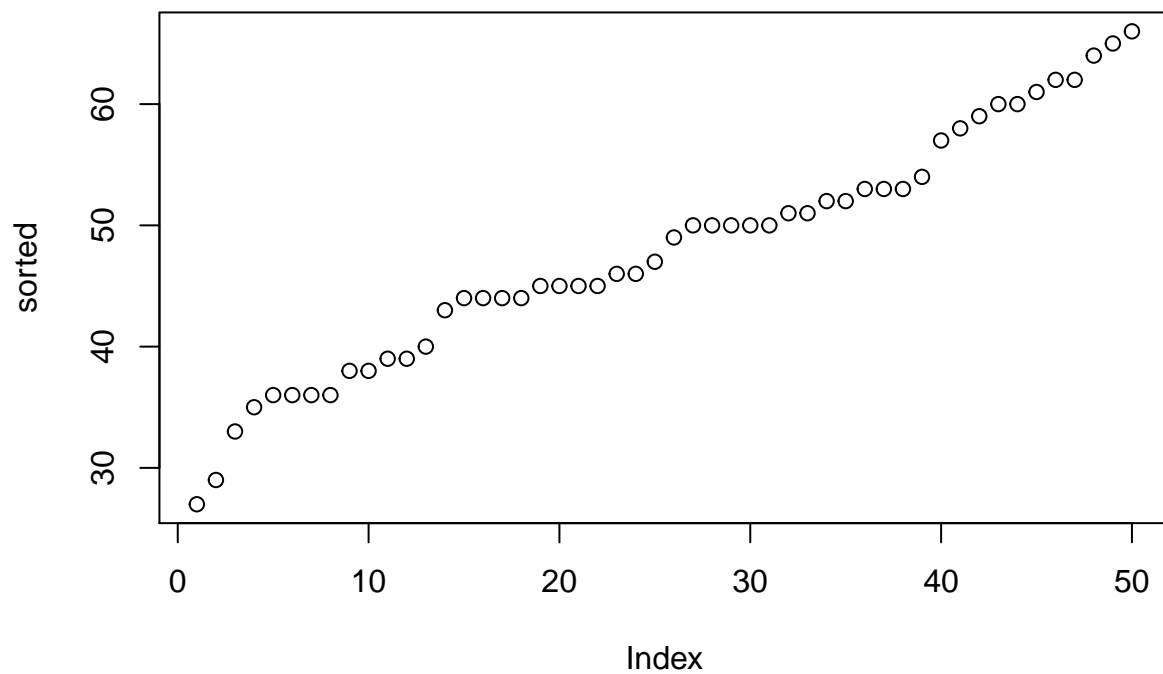

```
plot(f)
```

## Forecasts from HoltWinters

voorbeelde met stijgende data

```
sorted <- sort(x)
plot(sorted)
```

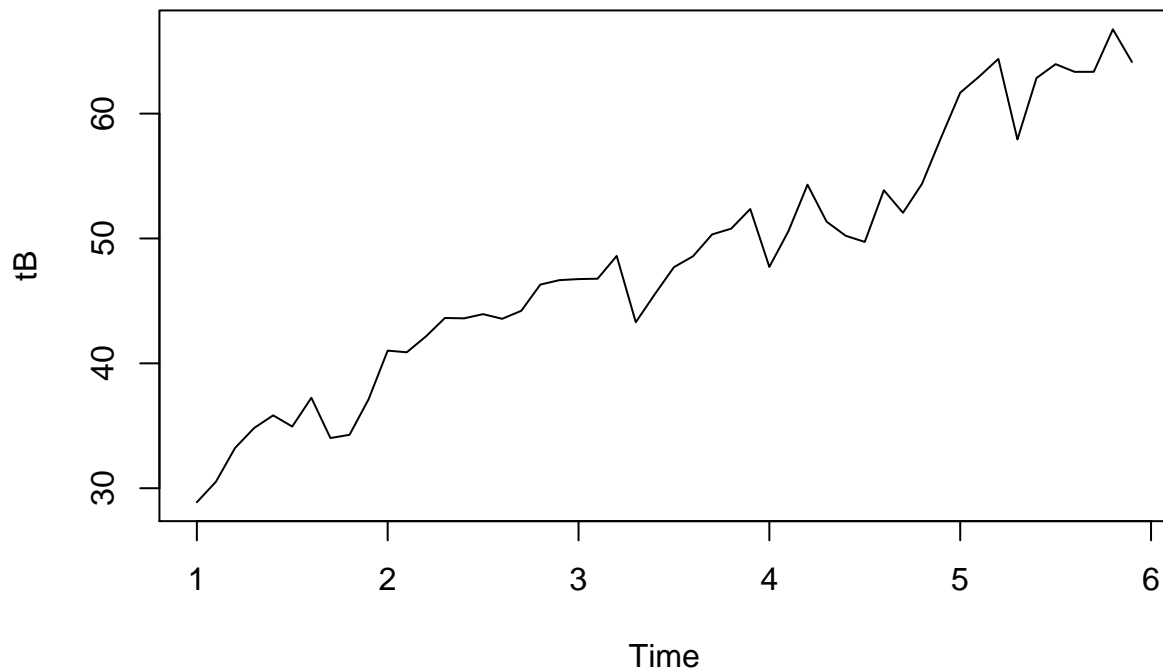

```
# dataset laten variëren
```

dataset laten variëren:

```
eta <- rnorm(50,0,2)  
betaTS <- sorted + eta
```

tijdsreeks maken

```
tB <- ts(betaTS, frequency = 10)  
plot(tB)
```

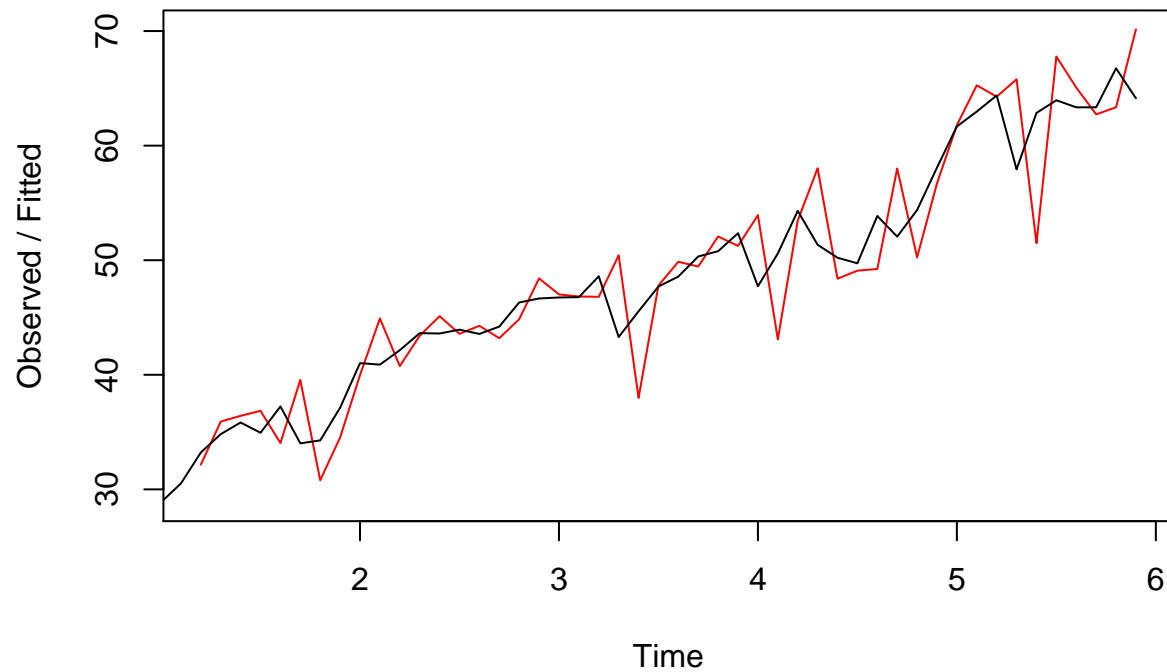

de grafiek stijgt, dus we moeten beta gerbuiken

```
fitB <- HoltWinters(tB, alpha = TRUE, beta = TRUE, gamma=FALSE)
fitB
```

```
## Holt-Winters exponential smoothing with trend and without seasonal component.
##
## Call:
## HoltWinters(x = tB, alpha = TRUE, beta = TRUE, gamma = FALSE)
##
## Smoothing parameters:
##  alpha: TRUE
##  beta : TRUE
##  gamma: FALSE
##
## Coefficients:
##      [,1]
## a 64.133748
## b -2.613645
```

```
plot(fitB)
```

## Holt-Winters filtering

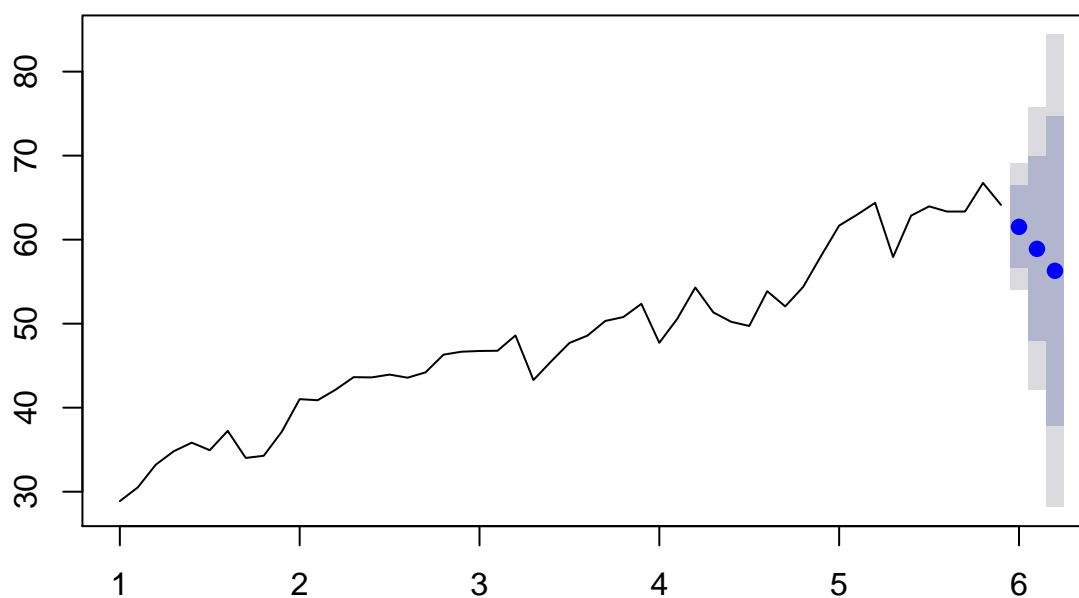

de eerste drie zijn niet ingevuld, want er zijn minstens drie voorgaande observaties nodig om een voorspelling te kunnen maken.

### voorspelling maken

```
fB <- forecast(fitB, 3)
plot(fB)
```

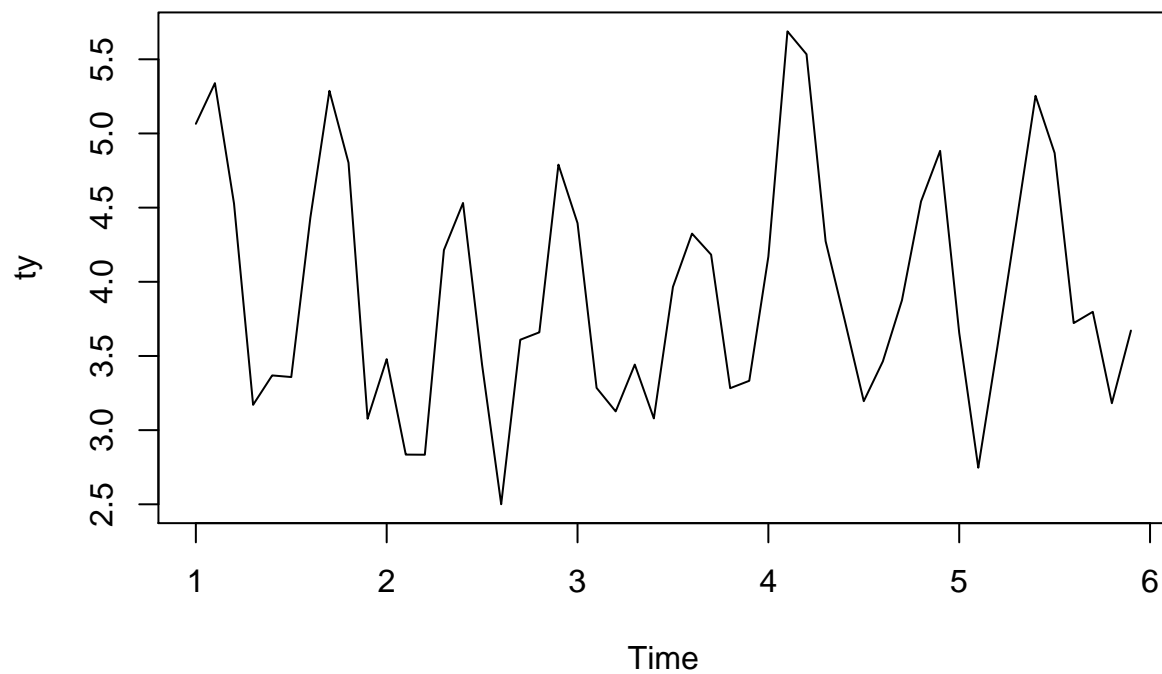

## Forecasts from HoltWinters

werken met een seizoenscomponent

```
x <- seq(1:50)
y <- sin(x)
eta <- rnorm(50,0, 0.5)
y <- y + 4 + eta
ty <- ts(y, frequency = 10)
plot(ty)
```

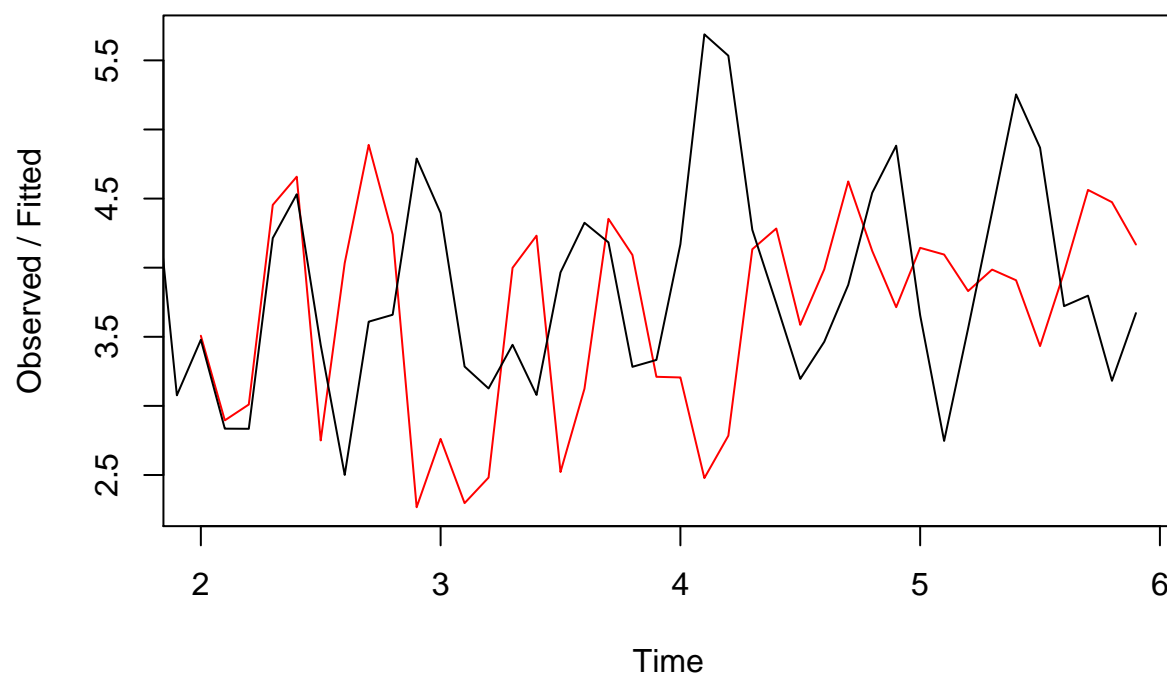

```
my <- HoltWinters(ty)
```

```
## Warning in HoltWinters(ty): optimization difficulties: ERROR:  
## ABNORMAL_TERMINATION_IN_LNSRCH
```

```
plot(my)
```

## Holt-Winters filtering

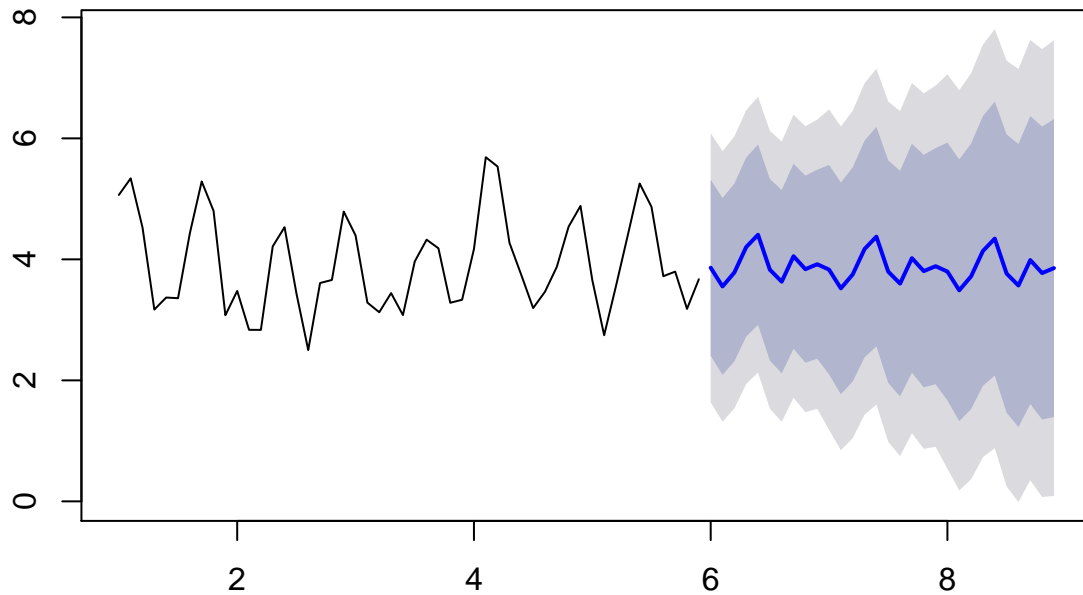

my

```
## Holt-Winters exponential smoothing with trend and additive seasonal component.
##
## Call:
## HoltWinters(x = ty)
##
## Smoothing parameters:
##  alpha: 0.09116534
##  beta : 0.08374552
##  gamma: 0.3788357
##
## Coefficients:
##           [,1]
## a      3.674928466
## b     -0.003194177
## s1      0.190440269
## s2     -0.116127957
## s3      0.117748718
## s4      0.540807390
## s5      0.748145882
## s6      0.173250598
## s7     -0.021100405
## s8      0.402600026
## s9      0.191529020
## s10     0.276532075
```

```
##voorspelling
fy <- forecast(my, 30)
plot(fy)
```

## Forecasts from HoltWinters

merk op dat de periodes (de dalen en de pieken) worden meegenomen in de voorspelling

## voorbeeld blz 120: het voorstellen van een tijdsreeks

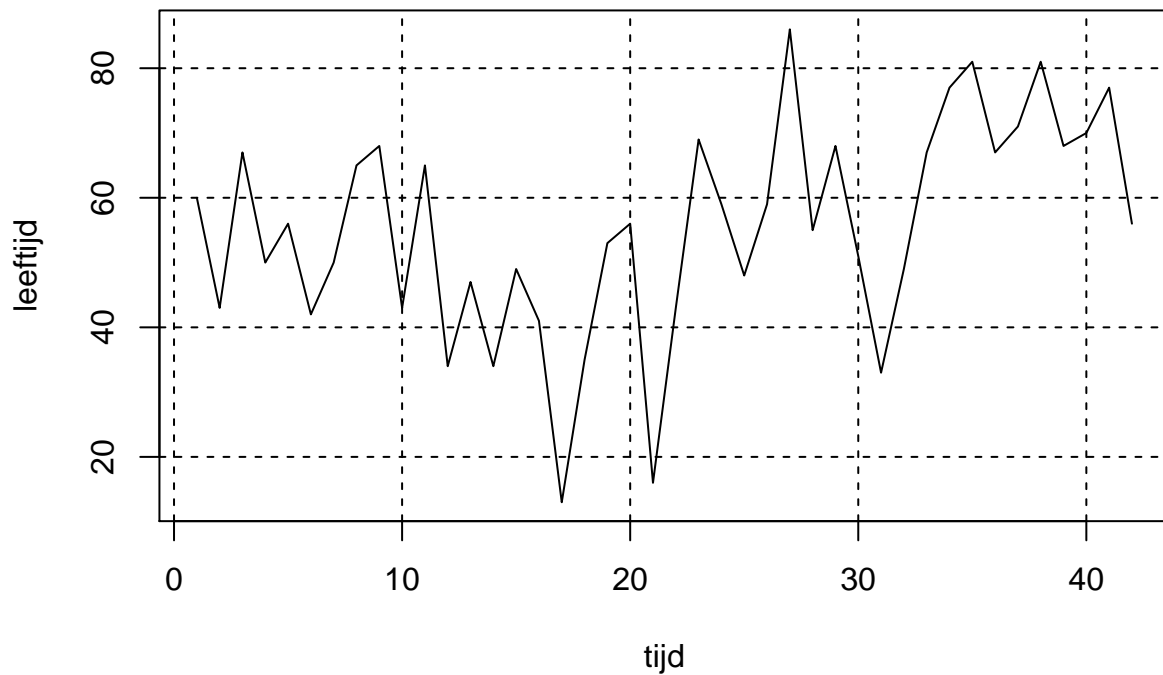

```
kings <- scan(file = "C:\\Users\\tijsm\\Google Drive\\HoGent 2018-2019\\2e semester\\Onderzoekstechniek\\")
```

```
kings
```

```
## [1] 60 43 67 50 56 42 50 65 68 43 65 34 47 34 49 41 13 35 53 56 16 43 69
## [24] 59 48 59 86 55 68 51 33 49 67 77 81 67 71 81 68 70 77 56
```

```
kingstimeseries <- ts(kings)
```

```
plot.ts(kingstimeseries, ylab = "leeftijd", xlab="tijd")
grid(lty = 2, lwd = 1, col = "black")
```

voorbeeld blz 123 ev. : voorschrijdend gemiddelde

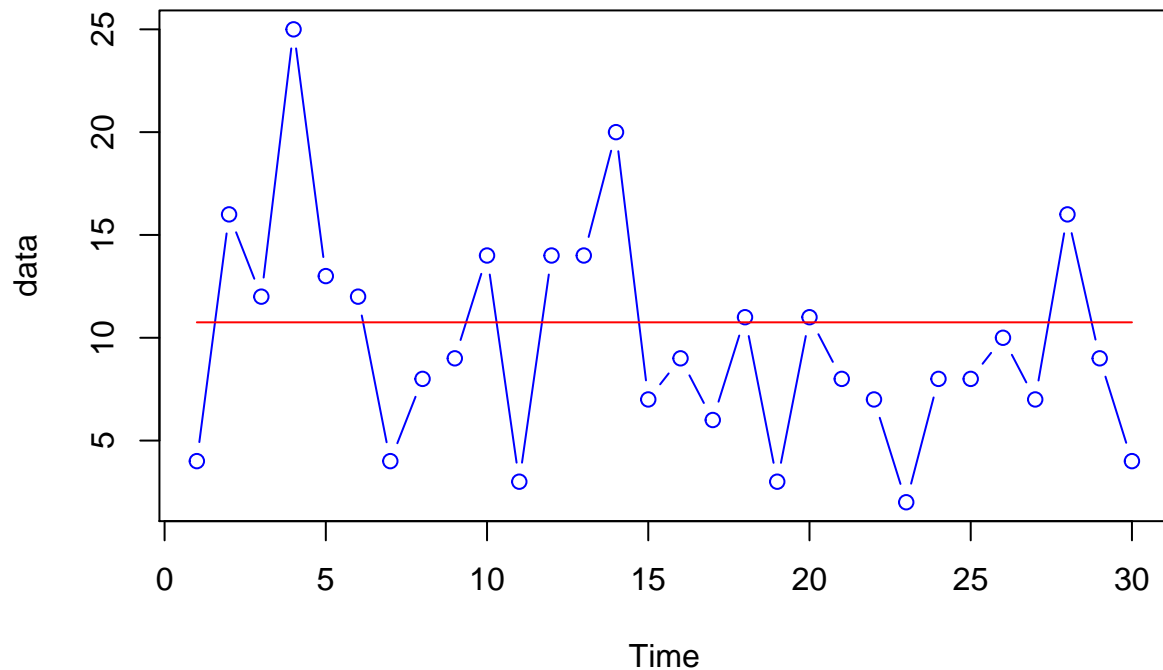

```
data <- c(4 , 16 , 12 , 25 , 13 , 12 , 4 , 8 , 9 , 14, 3 , 14 , 14 , 20 , 7 , 9 , 6 , 11 , 3 , 11, 8 , '
testData <- c(4 , 16 , 12 , 25 , 13 , 12 , 4 , 8 , 9 , 14, 3 , 14 , 14 , 20 , 7 , 9 , 6 , 11 , 3 , 11)

gem <- mean(data[1:20]) # het gemiddelde van de eerste 20 getallen
gem

## [1] 10.75
mean(testData)

## [1] 10.75
gemy <- rnorm(n = length(data), mean = gem, sd = 0)

plot.ts(data, type = "b", col = "blue")
lines(gemy, type = "l", col = "red")
```

we merken dat  $x_1 = 4$  (de eerste waarde) evenveel invloed heeft op het gemiddelde als  $x_{20} = 11$   
het gemiddelde als schatter gebruiken is dus geen goed idee

```
#library(smooth)
#library(Mcomp)

library('forecast')

#sma10 <- SMA(x =data,n=10)
#sma5 <- SMA(x=data,n=5)
#plot.ts(x = data, col = 'blue',type = 'l')
#lines(sma10, col='red', type = 'b')
#lines(sma5, col='purple', type = 'b')

# SMA function is niet gekend
```

## voorbeeld blz 126: enkelvoudige exponentiële afvlakking

```
rain <- kings <- scan(file = "C:\\Users\\tijsm\\Google Drive\\HoGent 2018-2019\\2e semester\\Onderzoeks\\rain")
```

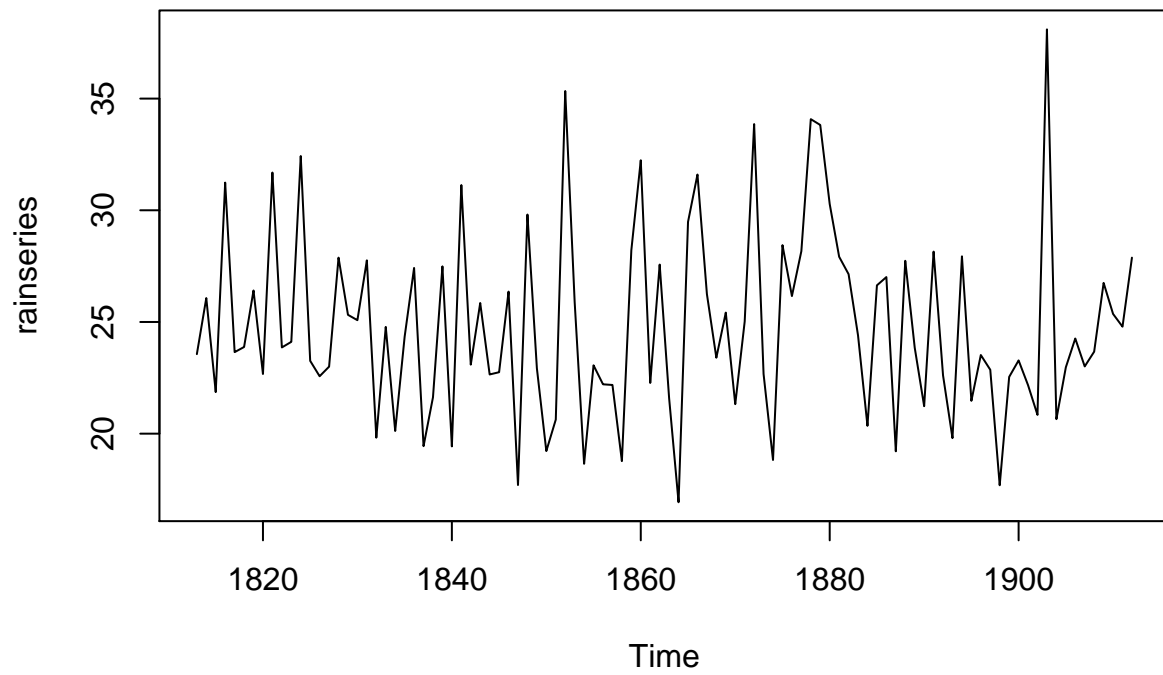

```
## [1] 23.56 26.07 21.86 31.24 23.65 23.88 26.41 22.67 31.69 23.86 24.11

## [100] 27.88
```

```
plot.ts(rainseries)
```

```
plot(rain) # van waar komt dit forecast?????
```

## oefening 8.1.

### opgave

wat zou volgende tijdsreeks kunnen voorstellen

### oplossing

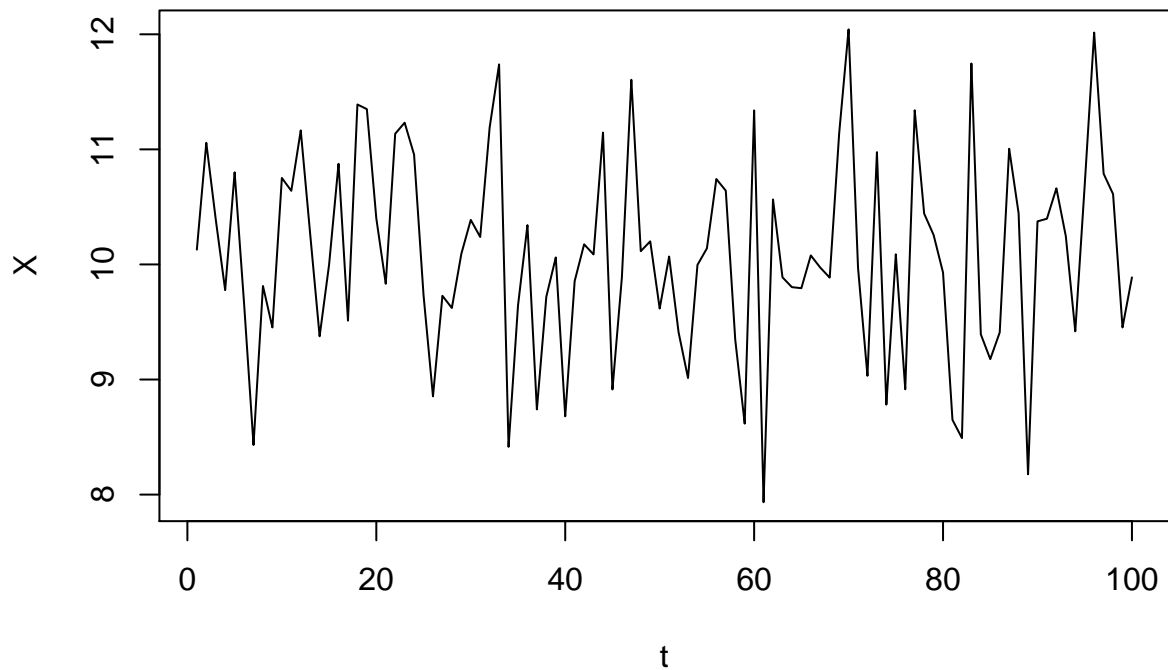

tijdsreeks grafisch voorstellen

```
f <- function (a , b , t ){
  return (a + b * sin ((2 * pi*4) / 4) + b * cos ((2 * pi*4) / 4) + rnorm (1) )
}

t <- seq(from = 1, to = 100, by = 1)

X <- lapply (t , f , a=5,b=5)

plot (x = t , y = X, type = 'l')
```

## oefening 8.2.

```
budgets <- read.csv("C:\\Users\\tijsm\\Google Drive\\HoGent 2018-2019\\2e semester\\Onderzoekstechnieken\\")
```

```
budgets
```

4.

aangezien er 4 kwartalen zijn in een jaar is deze dataset “seasonal”. Voor dit soort data set is driedubbele exponentiële smoothing voorzien.

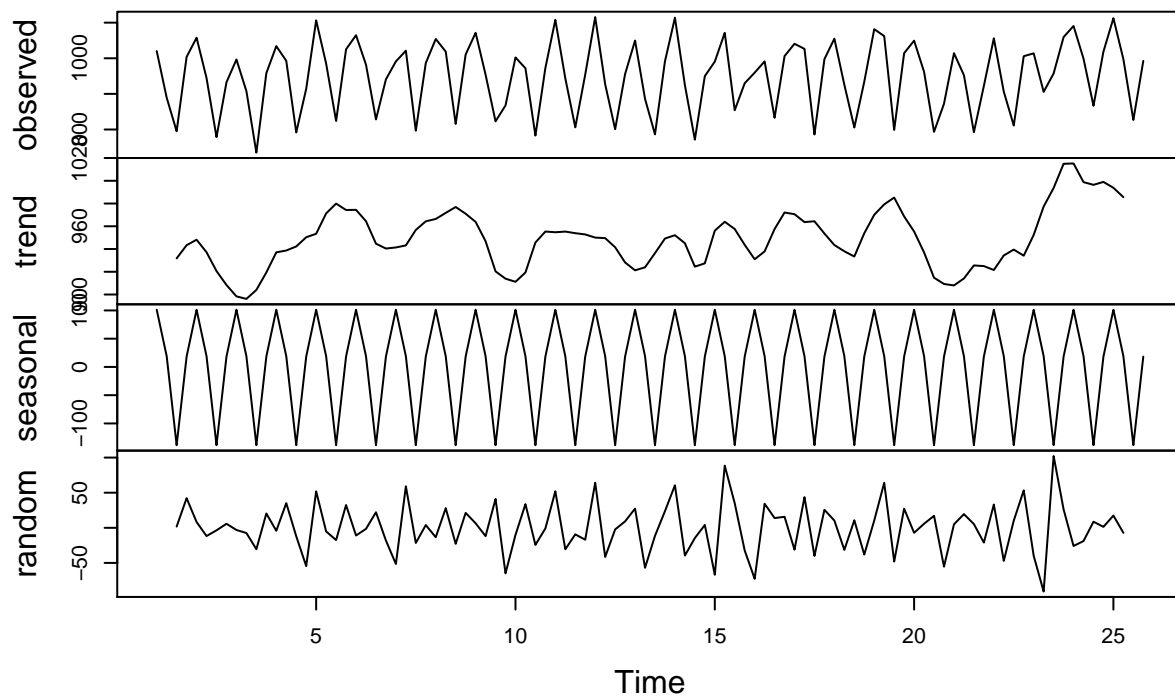

Als er enkel een trend was, zou dubbele exponentiële smoothing volstaan.
